

### Proven Research:

The Perry Study has a similar program to “My World.” 128 children were studied from age three to 40 years old, 63 of those children went through the program – the other 63, in the control group, did not use the program. Evidence of Effectiveness: • At age 27 completed an average of almost one full year more of schooling (11.9 years vs. 11 years). • Spent an average for 1.3 fewer years in special education services – e.g. for mental, emotional, speech, or learning impairment (3.9 years vs. 5.2. years). • 44 percent higher high school graduation rate (65 percent vs. 45 percent).
